

For air and hydraulic cylinders

FLOATING CONNECTOR

Extends the life of the cylinder and realizes smooth movement.

HIROTA MFG. CO., LTD.

Protects the rod type cylinder from misalignment and parallelism error and maintains smooth movement!

In addition to the miniature type and standard type, when the pushing load is large lineup to strong types that demonstrate great power.

The standard type has the best lateral load followability due to ball bearings.

Overview

There are many troubles such as the cylinder does not move smoothly, intermittent chattering and galling occur especially when the speed is slowed down, or as a result of long-term use, the rod bends, air leakage occurs because the bearing is worn out.

In most cases, these are caused by misalignment between the cylinder and the object to be operated, or lack of parallelism. Floating Connector (FLOCON) is a product that reduces the burden on the installation worker due to such like these misalignment, eliminates troubles, and dramatically extends the life of the cylinder and equipment.

Feature

- ① Since the alignment and parallelism between the cylinder and the object to be operated can be adjusted by eye measurement level, the cylinder can be easily installed.
- ② Since the structure does not apply an strong lateral load, the life of the cylinder can be extended and smooth movement can be obtained.
- ③ There are a wide variety of models from mini type to large and powerful type considering various mounting locations.
- ④ Save time and expenses and improve work efficiency.

Lateral load during operation

Standard type (Rolling system)

The standard type FLOCON uses bearings to reduce the coefficient of friction, operate at about 1/25 or less of the cylinder thrust, significantly reduce the lateral load, and perfectly absorb misalignment.

Lateral load required for operation =
Cylinder thrust (Load) "F" × Coefficient of friction " μ "

Coefficient of friction $\mu = 0.04$ or less

Lateral load of rolling system " $F\mu$ " (at 0.5MPa)

Bore size μ	$\phi 20$	$\phi 32$	$\phi 40$	$\phi 50$
0.04	6.1N	15.7N	24.7N	38.5N

Strong type (Sliding system)

The strong type FLOCON uses slide plate instead of the bearing, so it shows great power when the pressing load is large.

Lateral load required for operation =
Cylinder thrust (Load) "F" × Coefficient of friction " μ "

Coefficient of friction $\mu = 0.4$

Lateral load of sliding system " $F\mu$ " (at 0.5MPa)

Bore size μ	$\phi 20$	$\phi 32$	$\phi 40$	$\phi 50$
0.4	61.7N	157.8N	247.1N	385.4N

Effect of FLOCON

- Prevention uneven wear of cylinder bearings
- Prevention abnormal wear of packing and seals
- Reduction of alignment man-hours during assembly
- Extend the life of cylinder and equipment
- Smooth cylinder operation
- Chatter reduction at low pressure operation
- Prevention of thrust reduction

Precautions for safe handling

- The threaded portion can be rotated, but FLOCON is not a fitting designed for rotational axis. So, do not use for rotational applications.
- No lubrication required.
Lubricating grease is already filled.
- Cannot be disassembled and reused.
- The maximum working load is the value at static load.
- Note that the working load value will be smaller if the impact is repeated.
- Cannot be used for TC, CA, CB type cylinders.

FLOATING CONNECTOR

FLOATING CONNECTOR

FC series

For air and hydraulic cylinders

Operating principles

The swing motion ① and eccentric movement motion ② of the ball joint are housed in a compact case to absorb the deviation in the three-dimensional direction.

Since the alignment and parallelism between the cylinder and the object to be operated can be adjusted by eye measurement level, the cylinder can be easily installed.

Comparison of load and lateral load

The left graph shows the values of the perpendicular movement force (F) at each axial load (f) for FC18T (Rolling system) and FC18T-S (Sliding system).

(The smaller the value of "f", the smaller the eccentric load on the bearing of the cylinder, and the more durable the cylinder.)

Usage example

Usage example for F type

- F type is used for the jack device of vertical transfer.

Usage example for L type

- L type is used for the slide base of the multi-axis drill unit.

Usage example for T type

- T type is used for the vertical movement JIG.
