

High Thrust Air Cylinder

PNEUMATIC POWER CYLINDER

Substantially increased thrust achieved by integrating a hydraulic cylinder and an air-hydro booster into a single unit.

HIROTAKA MFG. CO.,LTD.

Overview

The Pneumatic Power Cylinder is a booster-integrated air cylinder that combines rapid operation with high thrust performance, utilizing an original air hydraulic conversion mechanism powered by compressed air. The cylinder operates at high speed with thrust equivalent to a standard pneumatic cylinder during non-loading strokes.

For working strokes, it delivers high-power operation with thrust ranging from 5 to 440 kN.

Systems for press-fitting, clinching, cutting, crimping, bending, marking, punching, and clamping can be easily constructed using a simple pneumatic circuit.

Feature

- ① Delivers high thrust from 1 to 440 kN powered solely by compressed air.
- ② Custom long stroke can be manufactured to meet your needs. (100 mm or more)
- ③ Our unique internal design enables high speed operation. (200 mm at 0.5 seconds or less)
- ④ Simple structure ensures trouble free operation.
- ⑤ Can be controlled using only pneumatic valves.
- ⑥ Thrust can be adjusted steplessly by changing the air pressure.
- ⑦ Auto Switch equipped model
(Symbol : PCMW, PCSW, PCHW)
While the standard model uses proximity sensors or limit switches for position detection, the auto switch equipped model simplifies this process with auto switches mounted directly on the hydraulic cylinder.
- ⑧ Solenoid valve equipped model
(Symbol : PCMV*, PCSV*, PCHV*)
Equipped with solenoid valves, the unit only requires a compressed air supply for operation, significantly reducing installation time and effort.
- ⑨ Solenoid valve and auto switch equipped model
(Symbol : PCMV*W, PCSV*W, PCHV*W)
The integration of solenoid valves and auto switches makes this unit extremely easy to operate and install. Optional attachments for control valve models include spacer type regulators for thrust control and safety valves to prevent dropping upon loss of air pressure.
- ⑩ Stop valve equipped model (Symbol : V*)
Capable of instant mid stroke stopping for emergency stop and inching operation.
(Compatible with top dead center adjustments and high thrust stroke cycling.)

Structure and Operating Principle

Pneumatic Thrust Stroke

When air is supplied to the P3 port, the oil inside the air-hydro converter reaches the same pressure as the air, and the hydraulic piston moves forward at rapid.

High Thrust Stroke

When air is supplied to the P1 port, the hydraulic pressure is boosted based on Pascal's Principle, driving the hydraulic piston forward with high thrust. The high thrust stroke can be switched at any position. For the models in Table 2, switch to high thrust only after the pneumatic stroke exceeds the specified value.

Return Stroke

When air is supplied to the P2 port and P4 ports and other ports are exhausted, as the booster piston returns, the hydraulic piston simultaneously retracts at rapid return.

Intermediate Stop

If the stop valve is closed during rapid forward movement while simultaneously supplying air to P4 and exhausting P3, the hydraulic piston will stop instantly. Simply closing the stop valve during rapid return will stop the hydraulic piston.

Applications
Emergency Stop / Inching
Changing the Top Dead Center

Scope of Standard Models

Table 1 All models are rod side flange mounting.
(Symbols : ○ = Standard model, △ = Semi-standard model)

Note

- Total stroke refers to the full operational range, including both the pneumatic thrust stroke and the high thrust stroke.
- The high thrust stroke can be switched at any position within the total stroke. For the types listed in Table 2, the pneumatic thrust stroke must exceed the values specified in the table from the retracted position before switching to the high thrust stroke.
(To ensure the high thrust stroke)
- Models other than those listed in the table.
PCH-35-1020 70 mm
PCH-35-1520 20 mm
PCH-44-1015 50 mm
PCH-44-1520 125 mm
PCH-44-2020 75 mm
- Custom strokes are also available. Contact us for further information.
- As the overall length and other dimensions of semi-standard models differ from standard models, please refer to the tables in the external dimension drawings (P. 6-P. 10).

* Piston speed mm/s	Rapid feed	300	300	300	300	280	280	280	200	200	200	150	150
	High thrust feed	30	29	27	27	25	22	20	16	13	10	10	8

* Piston speed is measured at 0.5 MPa, with no load, during forward.

* Any brand of mineral based hydraulic oil can be used. (ISO VG 22 or VG 32)

* As with conventional hydraulic cylinders, avoid applying eccentric loads to the piston rod.

* Due to the design of air-hydro cylinders, a trace amount of oil seepage may occur during operation.

Since leaked hydraulic oil is exhausted through ports P3 and P4, the installation of an exhaust cleaner is recommended for pneumatic valve exhaust.
(Refer to page 13 for products with rod oil film remover specifications.)

Unit : L

Note)

These values represent the theoretical air consumption converted to atmospheric pressure for one full cycle at a supply pressure of 0.5 MPa.

Example)

The air consumption for PCH-03-1005
Model : PCH-03
Total stroke 100 mm : 7.3 L
High thrust stroke 5 mm : 8.8 L

Therefore, the total air consumption for one full cycle : 7.3 L + 8.8 L = 16.1 L

		0.7	5,490	11,210	21,990	42,420	34,360	61,080	87,960	137,440	173,950	240,760	346,700	445,320

Note 1) For vertical operation, ensure that the weight of jigs, dies, or other loads is kept below 50% of the Pneumatic thrust (Extension or Retraction) value, depending on the rod's direction of movement, to maintain stable operation and speed.

Note 2) To ensure stable operation and speed, the high thrust load should be kept below 70% of the High thrust value.

Note 3) For the model with Rod oil film scraper (Symbol : B), subtract 70 from the thrust values shown in the table.

How to Order

PCS V1 W - 02 - 05 05 - 3 - H2ME - V1 - B - RT - G - S2

Symbol	Series
PCM	Miniature type

Symbol	Auto switch types
Nil	Read auto switch
H2ME	Solid state auto switch

Symbol	Regulator for high thrust
Nil	Without regulator
R	With regulator

Only selectable model with operating valve. Selectable for all PCM models.

Symbol	Speed controller
S2	High thrust speed
S3	Return speed
S4	Rapid forward speed

Only selectable model with operating valve.
Multiple selection available
Example : S 234

Symbol	Oil pressure gauge
Nil	Without pressure gauge
G	MPa indication
GX	MPa-kN indication

For hydraulic pressure sensors, see "Accessories" on the separate sheet.

Symbol	Drop prevention valve
Nil	Without valve
T	With valve

Only selectable model with operating valve. Cannot be selected for PCM type.

How to Select the Model

- Determine the model that provides the required high thrust.
Example: If a thrust of 43,000 N is required at 0.5 MPa, refer to the thrust table and select PCH-08, which outputs 62,830 N at 0.5 MPa.
- Determine the total stroke required for the operation.
Example: If a 70 mm clearance is required between the punch and the workpiece for loading and unloading, set the total stroke to 100 mm to provide an adequate safety margin.

- Determine the high thrust stroke.
Example: For a bushing press fitting operation with a height of 2 mm, set the stroke to 3 mm (allowing for a 50% margin) and select the closest available stroke of 5 mm.
As a result, the selected model code is PCH-08-1005.

Required Oil Quantity

Unit : liter

Model	Total stroke	Required quantity
PCM-005, 01	05	0.20
	10	0.30

Note) For semi-standard products, the overall length and the minimum high thrust switching position are consistent with the table on page 10.

Rod Oil Film Scraper

PCM-B
PCS-B
PCH-B

A slight oil film on the piston rod surface resulting from normal sliding of standard seals is not considered "leakage." However, in processes such as electronic component molding or clinching, even a single drop of oil can lead to defective products. The Rod oil film scraper minimizes oil discharge from the piston rod sliding surface to near zero, protecting your components from oil contamination.

Internal Structure

As the piston slides, oil adhering to the inner surface of the hydraulic tube forms a thin film and flows toward the rod packing. As the rod seal is specifically designed for air pressure sealing, it cannot completely remove the oil film, which then travels along the rod surface to the exterior. The oil seal scrapes off the oil film before it can escape to the exterior, directing it to the drain port for discharge.

Regarding use in oil-sensitive environments (e.g., cleanrooms)

The "Rod Oil Film Scraper" is designed solely to address oil film on the piston rod surface.

Implement separate oil countermeasures for the solenoid valve's exhaust and drain ports.

Exhaust the solenoid valve through a mist separator as shown in the diagram.

(This diagram supplements the "Example of Air Circuit" on pages 14 and 15.)

Recommended product: Exhaust Cleaner
Maker: SMC, CKD, etc

Alternatively, pipe the exhaust to a centralized piping system and discharge it outdoors.

Drain port

As shown in the diagram, pipe the exhaust to a centralized piping system and discharge it outdoors.

Basic Pneumatic Circuit

The type without operating valves

PCM
PCS
PCH

- * Install the regulator at the position shown in the diagram when adjusting high thrust to a lower level.
(To prevent a reduction in cylinder return thrust)
- * Install the speed controller in the direction shown in the diagram to prevent negative pressure in the oil. (P1)

The type with operating valves

PCMV*
PCSV*
PCHV*

- * Install the regulator at the position shown in the diagram when adjusting high thrust to a lower level.
(To prevent a reduction in cylinder return thrust)
- An optional spacer-type regulator can be installed.
- * The silencer with throttle valve is included at the position shown to prevent negative pressure in the oil.
For the PCM series, it is included at the P1 port.

Circles (O) indicate air supply, and crosses (X) indicate air exhaust.

Operating condition	SOL-1	SOL-2	P1	P2	P3	P4	Progress
Stop	OFF	OFF	X	O	X	O	As shown in the figure
Pneumatic thrust stroke	ON	OFF	X	O	O	X	Rapid forward
High thrust stroke	ON	ON	O	X	O	X	High thrust forward
Return stroke	OFF	OFF	X	O	X	O	High speed return

How to Adjust Cylinder Speed.

Cylinder speed can be adjusted by installing meter-out type speed controllers on each port.

P2 : High Thrust Stroke Speed

P3 : Return Stroke Speed

P4 : Pneumatic Thrust Stroke Speed

Drop prevention measures during air supply loss.

Installing a pilot check valve on the P4 port and using the supply air as pilot air prevents the cylinder from dropping own weight.

Note: The piston rod may gradually drop over time due to air leakage. When exhausting residual pressure, there is a risk of sudden movement due to the cylinder's own weight. Ensure safety measures, such as using safety blocks, are in place before operation.

The type with drop prevention valve

PCSV*-T PCHV*-T

- * The drop prevention valve is used to prevent the piston rod from falling due to its own weight at the stroke end or at an intermediate stop position when the air supply is cut off.

Note: The piston rod may gradually drop over time due to air leakage.

When exhausting residual pressure, there is a risk of sudden movement due to the cylinder's own weight. Ensure safety measures, such as using safety blocks, are in place before operation.

- * The silencer with throttle valve is included at the position shown to prevent negative pressure in the oil.

Basic Pneumatic Circuit

The type with stop valve

PCM····V* PCS····V* PCH····V*

- * Install the regulator at the position shown in the diagram when adjusting high thrust to a lower level.
(To prevent a reduction in cylinder return thrust)
- * Install the speed controller in the direction shown in the diagram to prevent negative pressure in the oil. (P1)
- * When using the model with a stop valve, use 2 position single type operating valve. Such as 2 position double or 3 position closed center, the internal air pressure of the cylinder may be insufficient. As a result, the emergency stop or intermediate stop may fail to function, or there may be a delay before the operation comes to a stop.

How to Intermediate Stop (Emergency stop, Inching)

Circles (O) indicate air supply, and crosses (X) indicate air exhaust.

Operating condition	SOL-1	SOL-2	SOL-3	P1	P2	P3	P4	Progress
Stop	OFF	OFF	OFF	X	O	X	O	As shown in the figure
Pneumatic thrust stroke	ON	OFF	ON	X	O	O	X	Rapid forward
Intermediate stop	OFF	OFF	OFF	X	O	X	O	Intermediate stop
High thrust stroke	ON	ON	ON	O	X	O	X	High thrust forward
Return stroke	OFF	OFF	ON	X	O	X	O	High speed return

However, during high thrust stroke operation, the unit will stop after returning to the high thrust start position.

How to continuous operation for high thrust stroke drive only

Circles (O) indicate air supply, and crosses (X) indicate air exhaust.

Operating condition	SOL-1	SOL-2	SOL-3	P1	P2	P3	P4	Progress
① Stop	OFF	OFF	OFF	X	O	X	O	As shown in the figure
② Pneumatic thrust stroke	ON	OFF	ON	X	O	O	X	Rapid forward
③ High thrust stroke	ON	ON	ON	O	X	O	X	High thrust forward
④ High thrust return stroke	OFF	OFF	OFF	X	O	X	O	High thrust + α stroke return (Note 1)
⑤ High thrust stroke	OFF	ON	OFF	O	X	X	O	α stroke + High thrust forward (Note 1)
⑥ Return stroke	OFF	OFF	ON	X	O	X	O	High speed return

(Note 1) α stroke refers to an extra retraction that returns α mm further than the starting position of the high thrust stroke.

High thrust is not applied during the α stroke forward. The table below shows the α stroke for each model.

Model	α stroke (mm)

Solenoid specifications

Rated voltage	100 VAC (50/60 Hz)	200 VAC (50/60 Hz)	24 VDC
Starting current	0.170/0.140 A	0.090/0.070 A	0.250 A
Holding current	0.100/0.080 A	0.050/0.040 A	
Power consumption	5.0/4.0 W	5.0/4.0 W	6 W
Thermal class	B (Molded coil)		
Wiring method	DIN connector		

PCSV* PCHV*

Valve specifications	
Fluid	Air
Operating pressure	0.15 to 0.97 MPa
Ambient temperature	Ambient temp: -5 to 60°C, Fluid temp: 5 to 60°C
Action	Pilot operated
Effective sectional area	PCSV*, PCHV*03 to 08 : 33 mm ² PCHV*13 to 24 : 65 mm ²
Lubrication	No required
Manual operation	Non-locking push type

Solenoid specifications

Rated voltage	100 VAC (50/60 Hz)	200 VAC (50/60 Hz)	24 VDC
Starting current	0.056/0.044 A	0.034/0.026 A	0.042 A
Holding current	0.028/0.022 A	0.017/0.013 A	
Power consumption	1.8/1.4 W	2.1/1.6 W	1.2 W
Thermal class	B (Molded coil)		
Wiring method	DIN connector, with surge suppressor, lamp		

Stop valve

PCM...V* PCS...V* PCH...V*

Valve specifications	
Fluid	Air
Operating pressure	0.3 to 0.7 MPa
Ambient temperature	Ambient temp: -5 to 50°C, Fluid temp: 5 to 50°C
Action	Pilot operated
Port size	Rc 1/8
Effective sectional area	7 mm ²
Lubrication	No required
Manual operation	Non-locking type

Solenoid specifications

Rated voltage	100 VAC (50/60 Hz)	200 VAC (50/60 Hz)	24 VDC
Starting current	0.056/0.044 A	0.028/0.022 A	0.075 A
Holding current	0.028/0.022 A	0.014/0.011 A	
Power consumption	1.8/1.5 W	1.8/1.5 W	2.0 W
Thermal class	B (Molded coil)		
Wiring method	DIN connector, with surge suppressor, lamp		

Wiring

Incorrect wiring of the terminals may cause malfunctions, such as improper solenoid valve operation. Refer to the diagram below for terminal wiring.

Wiring diagram

Stop valve

PCM...V* PCS...V* PCH...V*

Restriction of leakage current

When using a Programmable Logic Controller (PLC), leakage current may prevent the solenoid valve from switching off, even when de-energized. Ensure that the leakage current is below the values specified in the table below.

AC100V	3.0 mA or less
AC200V	1.5 mA or less
DC24V	1.8 mA or less

Handling Precautions

1 Installation Direction

Install the Pneumatic Power Cylinder with the piston rod facing downward. Upward or horizontal mounting is possible, but the standard type cannot be used in these orientations. Please consult us during your planning stage. (Custom model)

Installation of air-hydro converter.

When installing the air-hydro converter away from the cylinder body, install on the equipment side using the mounting brackets of each type of air-hydro converter.

PCM series air-hydro converter is easy to install using PCS series mounting bracket.

Connect the air-hydro converter and the Pneumatic Power Cylinder body using low-pressure hydraulic piping.

For the upward-facing PCH Series, some models feature an air release valve located the wrench flats of the piston rod. Perform air bleeding once every one or two months.

2 Checking the Hydraulic Oil Level

Oil level gauge is included on the side of the air-hydro converter. Refill the oil when the level falls below the MIN mark while the piston rod is fully retracted.

3 Use in Punching Applications

Since the Pneumatic Power Cylinder is air-operated, if the reaction force drops abruptly during pressurization—such as in punching applications—the piston rod and ram may accelerate rapidly after punching the workpiece.

Select a longer high thrust stroke and ensure that an external shock absorbing stopper, such as urethane rubber, is installed. Examples: Deburring machine for castings, Destructive testing machine, Heavy plate punching machines, etc.

4 When using heavy jigs or dies

If the weight of the jig or die is too high relative to the cylinder's retraction thrust, it will affect operation, slow retraction speeds or a failure to retract.

In such cases, increasing the air supply pressure to the cylinder (P4 port) will increase the retraction thrust, which may improve the operation.

Additionally, by installing an auxiliary air cylinder to assist with the return stroke, you can increase the retraction thrust without changing the supply air pressure. (Refer to the diagram on the right.)

PCH

PCS

PCM

Install the air-hydro converter so that the P3 port is always positioned at the top, regardless of the mounting orientation of the pneumatic power cylinder body.

Operation Position Signal

1

Using models with auto-switches, the solenoid valve is switched at each position.

2

Uses proximity sensors or limit switches.

3

Switching to the high thrust stroke via a timer compensates for variations in workpiece height.

4

Monitoring the internal hydraulic pressure in addition to the position helps improve quality.

5

For even more precise quality control, the actual thrust value is measured using a load cell.

Mass

Unit: kg			
Model	Basic weight	Total stroke Additional weight per each 10 mm of stroke	High thrust stroke Additional weight per each 1 mm of stroke
PCM	4.0	0.20	0.1
PCM-B			
PCMW	4.2	0.20	0.1
PCMW-B			
PCS -02	12.8	0.25	0.1
PCSW -02			
PCS -04	13.3	0.25	0.2
PCSW -04			
PCSV* -02	14.5	0.25	0.1
PCSV*W-02			
PCSV* -04	15.0	0.25	0.1
PCSV*W-04			

Unit: kg			
Model	Basic weight	Total stroke Additional weight per each 10 mm of stroke	High thrust stroke Additional weight per each 1 mm of stroke
PCH-03	32	0.4	0.2
PCH-06	32	0.4	0.3
PCH-08	32	0.4	0.4
PCH-13	100	1.0	0.5
PCH-17	100	1.0	0.6
PCH-24	101	1.1	1.0
PCH-35	195	2.0	1.7
PCH-44	195	2.0	2.2

Example : PCH-08-1010

$32 + 0.4 \times 100 / 10 + 0.4 \times 10 = 40 \text{ kg}$

Applications

- Press Fitting
- Riveting
- Punching Press
- Bending Process
- Workpiece Holding for Leak Testers
- Molding
- Cutting
- Auto Marking
- Thomson Die-Cutting
- Crimping
- Caulking
- Work Clamping
- Drawing Press
- Compression Press
- Deburring
