

Air – hydro booster

RUSH BOOSTER

Generates high hydraulic pressure using only pneumatic power.
Build a hydraulic system with a simple pneumatic circuit.

HIROTAKA MFG. CO.,LTD.

from a pneumatic power

Easily generate hydraulic pressure !

The operation is easy and it is very economical.

RUSH BOOSTER

Overview

Rush Booster is a hydraulic generation unit capable of producing high hydraulic pressure using only compressed air.

It can be operated with one pneumatic valve and converted to high hydraulic pressure equivalent to 5 to 100 times the air pressure.

Ideal as a hydraulic source for short stroke cylinders, automatic clamping devices, and more.

Feature

- 1 Converts 0.4 MPa air pressure into 2 to 40 MPa hydraulic pressure.
- 2 Since it operates on pneumatic power, there is no risk of rising oil temperatures during continuous use or while maintaining pressure.
- 3 Steplessly adjust hydraulic output simply by changing the air pressure.
- 4 Control can be performed using a single pneumatic valve.
- 5 No surge pressure is generated, eliminating the need for an accumulator.

Operating Principle

When air is supplied to P1 of the Rush Booster, the piston moves forward.

Based on Pascal's principle, this generates high hydraulic pressure, allowing the hydraulic cylinder to advance with high thrust.

By supplying air to P2 and the return port of the hydraulic cylinder, the cylinder retracts with air pressure.

For single acting cylinders, air control is applied only to the Rush Booster.

How to Operate

Install the actuators, such as hydraulic cylinders or hydraulic clamps, onto the machine or equipment.

Connect the Rush Booster and the actuator using high pressure hoses, then fill the system with oil before operation.

Pneumatic and Hydraulic Piping

For double acting hydraulic cylinders, either branch the return side air piping of the Rush Booster or supply primary pressure at all times.

※ Regulator with backflow function is used to adjust the hydraulic pressure.

16	16 times
25	25 times
28	28 times
⋮	⋮

Example

RB160-30-65

Bore size : 160 mm
 Amount of discharged oil : 30 cm³
 Pressure boosting ratio : 65 times

Selection Method for the Model Number

Determine the boosting ratio of Rush Booster and discharge oil amount from each of the operating air pressure, required force, and hydraulic cylinder diameter.

Example) Operating air pressure : 0.5 MPa, required cylinder force : 6.5 ton

In the graph, raise the position of air pressure 0.5 MPa and cylinder force 6.5 ton upward, and select the boosting ratio above the position where each cylinder diameter and horizontal line.

If a cylinder diameter of 80 mm is selected, the boosting ratio of Rush Booster is 28 times. (There are other combinations.)

Next, determine the discharged oil amount from the Rush Booster.

If the total stroke of the hydraulic cylinder is 20 mm, the volume inside the hydraulic cylinder is

$\phi 80$ area (cm²) $\times$ 0.2 cm = 100 cm³.

Considering the expansion of the hydraulic hose, the compression of oil, etc., the amount of oil discharged from the Rush Booster should be 1.5 times or more.

As a result, the model number of the Rush Booster will be "RB160-160-28".

Estimated Amount of Oil Compression

$$\Delta V = 10 \beta P V_1$$

Oil temperature	20°C	40°C	60°C
β	6.8×10^{-5}	7.7×10^{-5}	8.6×10^{-5}

V_1 = Original volume (Inside volume of the hydraulic cylinder and piping)

β = Compression rate

P = Oil pressure (MPa)

ΔV = Estimated amount of oil compression

Hydraulic Piping

Take measures to prevent air from accumulating in the hydraulic piping and take measures so that air can be released when air accumulates.

Maintainability is also improved by making one place where air collects.

The air returning to the Rush Booster side is naturally released in the oil gauge.

- Rush Booster is positioned above the hydraulic cylinder.

- Rush Booster is positioned below the hydraulic cylinder.

- The layout of hydraulic piping becomes arched piping.

- Fast operation cycle

Mounting and Adjustment

- RB100 and RB160 can be installed downward or upward at the oil discharge port in addition to horizontal installation. In that case, attach the oil gauge with elbow fitting etc. so that the oiling cap (red collar) is on the upper surface. (Rush Booster side oil gauge connecting port size: Rc 1/4, Oiling port size: PF3/8)

- If the position of the oil gauge is lower than the installation position of the hydraulic cylinder, the oil in the hydraulic piping may return to the oil gauge and overflow from the oiling cap. In that case, use the low oil pressure piping and install the oil gauge at a position higher than the hydraulic cylinder. Also, by installing the oil gauge at a position higher than the hydraulic cylinder, it becomes easier to release air from the air release valve on the hydraulic cylinder side.

※The oil pressure in the low oil pressure piping is always close to no pressure.

- Be sure to install a meter-out speed controller on the head side of Rush Booster.

If the return speed of Rush Booster is too fast, the oil pressure will become negative and air bubbles will be generated, which may cause insufficient pressurization, insufficient stroke, oil leakage, etc.

After installation, slow down the return speed of Rush Booster as much as possible when air release, gradually increase the return speed after air release, and do not open the speed controller any more when there is no change in the return speed of the hydraulic cylinder.
